

Collisions with ScrollObjects

Collisions can be tested in ScrollObjects using the `OnCollide` function. The incoming `_poCollider` is the ScrollObject that is colliding with this ScrollObject.

Also, the individual parts of both ScrollObjects that are colliding are available in the function.

```
void Enemy::OnCollide(ScrollObject *_poCollider,
    orxBODY_PART *_pstPart,
    orxBODY_PART *_pstColliderPart,
    const orxVECTOR &_rvPosition,
    const orxVECTOR &_rvNormal)
{
    if (_poCollider == orxNULL) {
        return orxTRUE;
    }

    const orxSTRING colliderName = _poCollider->GetName();
    if (orxString_SearchString(colliderName, "Ship") != orxNULL) {
        const orxSTRING shipPartName =
orxBODY_GetPartName(_pstColliderPart);
        const orxSTRING enemyPartName = orxBODY_GetPartName(_pstPart);
    }
}
```
