# Part 14 – FX

Every game needs an objective. In our game, the hero needs to the top of the platforms to reach the flashing star.

We don't have a star asset, so I've provided one below:

Right and click this image and save it as “star.png” in the data/object folder.

Create a object section for this star and position it at the top right hand platform:

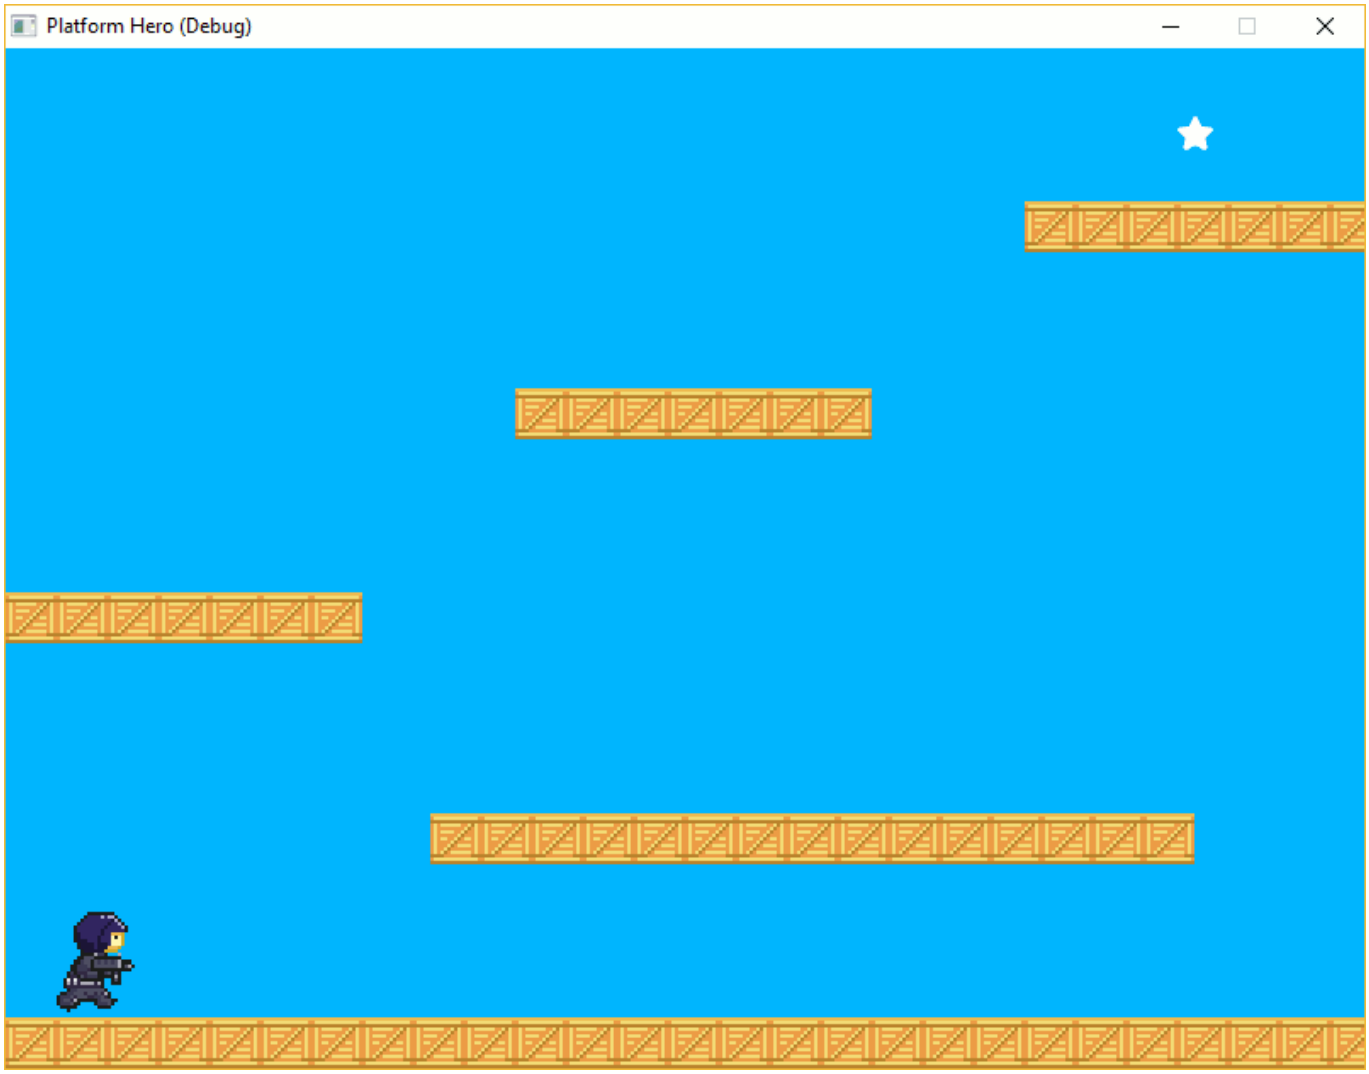

```
[StarGraphic]
Texture = star.png

[StarObject]
Graphic  = StarGraphic
Position = (690, 40, 0)
```

Add the star to the Scene section's child list so that it is created when the platforms are:

```
[Scene]
ChildList = PlatformObject # MiddlePlatformObject #
TopLeftPlatformObject # TopPlatformObject # TopRightPlatformObject #
StarObject
```

Run the game and you will have a star in the top right hand corner:

It will be nice if the star pulses colour and slowly turns. We can use two FXSlot sections for this:

```
[StarFlashSlotFX]
Type       = color
Curve      = sine
StartTime  = 0
EndTime      = 1
Absolute   = true
StartValue = (255,0,0)
EndValue   = (255,255,0)

[StarRotateSlotFX]
Type       = rotation
Curve      = linear
StartTime  = 0
EndTime    = 2
StartValue = 0
EndValue   = 359
```

Now group the two slots under one FX section:

```
[StarFX]
SlotList    = StarFlashSlotFX # StarRotateSlotFX
```

```
KeepInCache = true
Loop        = true
```

The FX section will be in charge of ensuring they stay in memory and that they both loop.

Add the FX to the StarObject:

```
[StarObject]
Graphic  = StarGraphic
Position = (690, 40, 0)
FXList   = StarFX
```

Cool. Run that and the star should turn and flash.

The only problem is that the turning pivot for the star is a little off. Fix that on the StarGraphic:

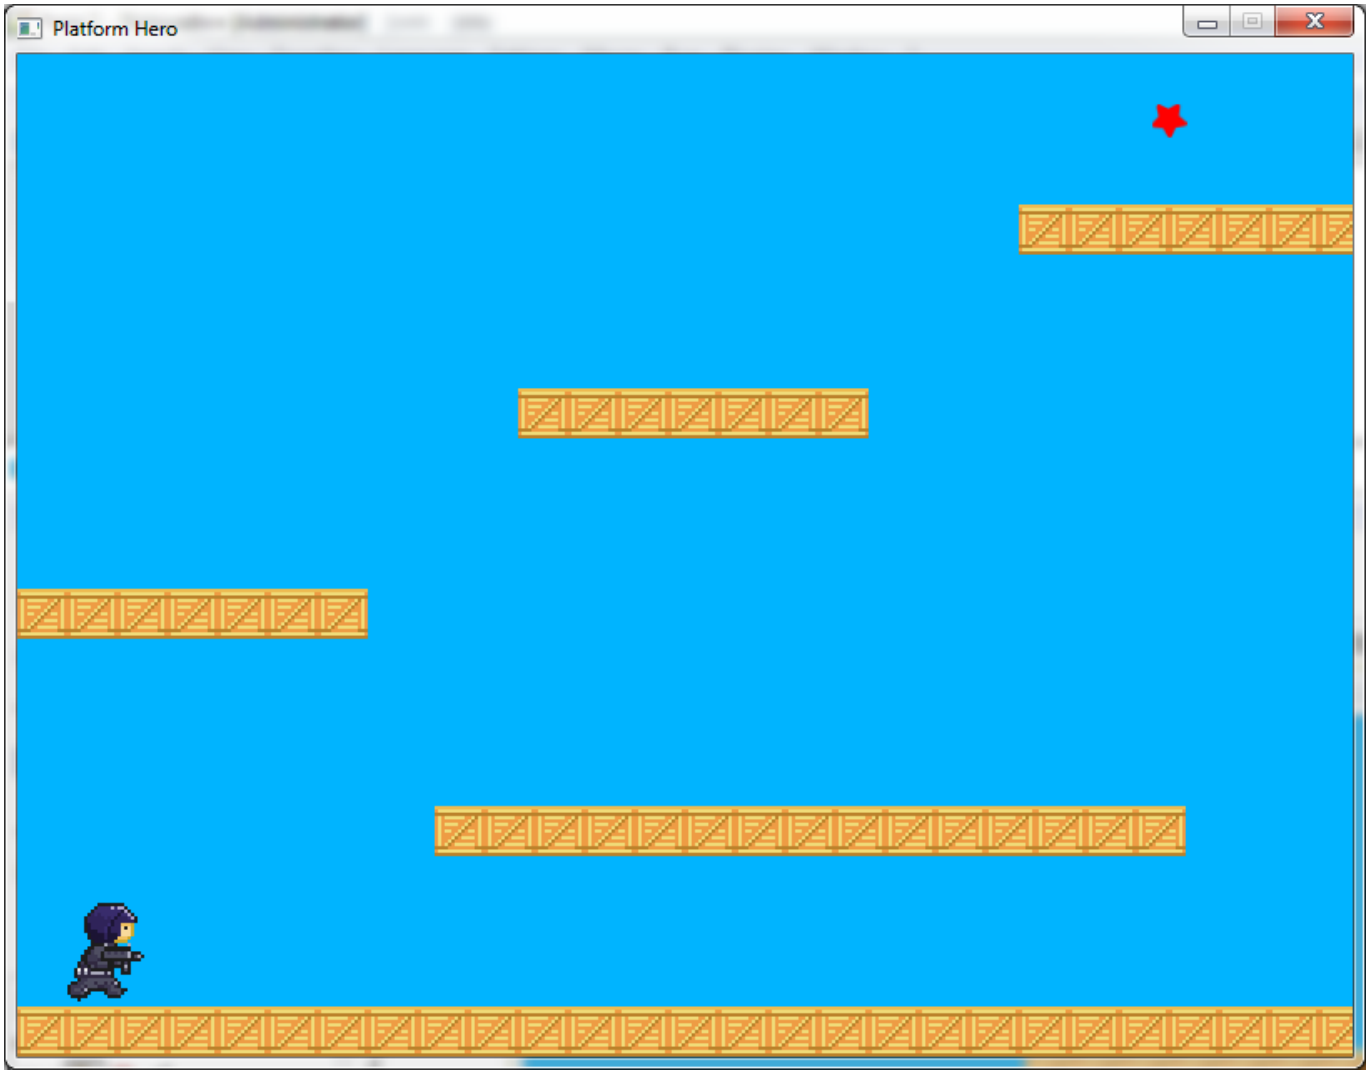

```
[StarGraphic]
Texture = star.png
Pivot   = center
```

Run that. And it will turn nicely.

One more tweak: As the sprite is turning, there are some jaggies, smooth them out my applying smoothing to the StarObject:

```
[StarObject]
Graphic   = StarGraphic
Position  = (690, 40, 0)
FXList    = StarFX
Smoothing = true
```

Run that and you should get:

Great! Next, is to make the hero collide with the star in order to win the game.

The star object will need a static body, with a solid body part:

```
[StarBody]
Dynamic   = false
PartList = StarBodyPart

[StarBodyPart]
Type        = box
Solid       = true
SelfFlags   = star
CheckMask   = hero
```

And add the body to the StarObject:

```
[StarObject]
Graphic   = StarGraphic
Position  = (690, 40, 0)
FXList    = StarFX
Smoothing = true
Body      = StarBody
```

We've also declared flags to make sure that we only care if the star collides with the hero and nothing else.

We will set that collision up in a moment.

---

Next: Part 15 – Collision Events.
