

Part 6 - Objects

Sprites in Orx are called Objects. These are the heart of games in Orx.

Our platform game is going to need a hero. Let's replace the default object in our game with a hero object.

We will need a graphic image for the hero. One is available in the data\object assets folder called soldier.png:

First we need to create a graphic config that knows about the soldier.png image:

```
[HeroGraphic]  
Texture      = soldier.png
```

Next, let's create an actual object that will use the HeroGraphic:

```
[HeroObject]  
Graphic      = HeroGraphic  
Position     = (50, 400, 0)  
Scale        = 2
```

When a HeroObject is created in code, he will be placed at co-ordinates 50, 400 on the screen and scaled up 2x in size.

In code, replace the default object with ours:

```
orxObject_CreateFromConfig("HeroObject");
```

Compile and run. You should get the following:

So that's great! Now you might be wondering, how does HeroGraphic know how to get solder.png from the data\objects folder? The answer is in the [Resource] section:

```
[Resource]
Texture = ../data/object
```

We can specify multiple paths here and we will do so further down the track.

So good job! Next step is to animate our soldier.
