

# Part 4 - A tour of an Orx project

Let's take a close look at all the parts of an Orx project (a Visual Studio one) and see how it all fits together, from the code to the building, the executing and the configuration files.

## Source

The source of your program is located in the src/ folder.

## Executable

The resulting executable is built and sent to the bin/ folder. If your project was called 01\_Object, the resulting executable would be 01\_Object.exe. If it was called Project, the executable would be Project.exe

## Config File

When the executable is run, it looks for a matching \*.ini file. If your executable was called 01\_Object.exe, it would load and process the 01\_Object.ini file. If your executable was called Project.exe, it would load and process the Project.ini file.

Now that you know all that, it is time to start working on our game.

---

Next: Beginning with the [viewport and the camera](#).
