

# Object

## OrxFrame

- Frame (scene node) Module. Allows to handles frame (scene nodes). It consists in a nodes (arranged in a hierarchical tree) having their position given in their parent local coordinate subsystem and caching their global one (in the root coordinate system). They're used to give position, rotation & scale to an object or a group of objects. Frames are structures. They thus can be referenced by Object Module.
- [Code Snippets](#)

## OrxFX

- FX module. Allows to creates rendering special effects affecting color, scale, rotation and position of visuals.
- [Code Snippets](#)

## OrxFXPointer

- FXPointer module. Allows to creates rendering special effects containers for objects.
- [Code Snippets](#)

## OrxObject

- Object module. Allows to creates and handle objects Objects are structures containers that can refer to many other structures such as frames, graphics, etc...
- [Code Snippets](#)

## OrxSpawner

- Spawner module. Allows to spawn orxSPAWNERS Spawners derived from structures
- [Code Snippets](#)

## OrxStructure

- Structure module. Allows to creates and handle structures. Structures can be referenced by other structures (or objects).
- [Code Snippets](#)

## OrxTimeLine

- TimeLine module. Allows to creates time lines: sequences of text events
- [Code Snippets](#)

## Config
